

**ABSTRACT**

A liquid dispenser bottle includes a suction tube and a spray nozzle. An end of the tube abuts an intersection of the bottle base and wall when the bottle is in use. A screen extending between opposite sides of a wall of the tube at the end where the intersection is located overcomes a tube tendency to collapse and enables liquid to flow from the corner of the bottle into the tube. Aesthetic undulations in the bottle wall cause liquid to flow therefrom toward the base when the bottle is vertically disposed, so liquid is not retained in the undulations.
